USAID INDONESIA POWERING ELECTRIFICATION PLANNING USING GEOSPATIAL MAP

USAID Indonesia applies geographic information system (GIS) to map village electrification, highlighting villages' areas with no access to electricity. This work is part of the rural electrification planning support to provincial governments under the Regional Energy Plan (RUED) program. The GIS-based maps illustrate the existing condition of villages classified as with and without access to electricity. The maps will serve as reference for the provincial governments in developing their respective regional energy plan and determining priority for electrification programs. By the end of 2017, USAID Indonesia has developed and provided village-level provincial electrification maps of all 34 provinces to Ministry of Energy and Mineral Resources to be used for energy and electrification planning with provincial governments.
